NITROGEN-CONTAINING FUSED HETEROCYCLIC COMPOUNDS

5 BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to novel nitrogen-containing fused heterocyclic compounds having CRF (corticotropin releasing factor) antagonistic activity and
10 pharmaceutical compositions containing them.

Background Art

Corticotropin-releasing factor (hereinafter, abbreviated as "CRF") is a neuropeptide composed of 41
15 amino acids, and was isolated and purified as a peptide promoting release of adrenocorticotropic hormone (ACTH) from pituitary gland. First, the structure thereof was determined from sheep hypothalamus and, thereafter, the presence thereof was confirmed also in a rat or a human,
20 and the structure thereof was determined [Science, 213, 1394(1981); Proc. Natl. Acad. Sci USA, 80, 4851(1983); EMBO J. 5, 775(1983)]. An amino acid sequence is the same in a human and a rat, but differed in 7 amino acids in ovine. CRF is synthesized as a carboxy-terminal of prepro CRF, cut
25 and secreted. The CRF peptide and a mRNA thereof are

2.

present at the largest amount in hypothalamus and pituitary gland, and are widely distributed in a brain such as cerebral cortex, cerebellum, hippocampus and corpus amygdaloideum. In addition, in peripheral tissues, the
5 existence has been confirmed in placenta, adrenal gland, lung, liver, pancreas, skin and digestive tract [J. Clin. Endocrinol. Metab., 65, 176(1987); J. Clin. Endocrinol. Metab., 67, 768(1988); Regul. Pept., 18, 173(1987),
Peptides, 5 (Suppl. 1), 71(1984)]. A CRF receptor is a 7-
10 transmembrane G protein-coupled receptor, and two subtypes of CRF1 and CRF2 are present. It is reported that CRF1 is present mainly in cerebral cortex, cerebellum, olfactory bulb, pituitary gland and tonsil nucleus. On the other hand, the CRF2 receptor has two subtypes of CRF2 α and CRF2 β .
15 It was made clear that the CRF2 α receptor is distributed much in hypothalamus, septal area and choroids plexus, and the CRF2 β receptor is present mainly in peripheral tissues such as skeletal muscle and is distributed in a blood vessel in a brain [J. Neurosci. 15, 6340(1995);
20 Endocrinology, 137, 72(1996); Biochim. Biophys. Acta, 1352, 129(1997)]. Since each receptor differs in distribution in a living body, it is suggested that a role thereof is also different [Trends. Pharmacol. Sci. 23, 71(2002)].

As a physiological action of CRF, the action on the
25 endocrine system is known in which CRF is produced and

secreted in response to stress in hypothalamus and acts on pituitary gland to promote the release of ACTH [Recent Prog. Horm. Res., 39, 245(1983)]. In addition to the action on the endocrine system, CRF acts as a neurotransmitter or a neuroregulating factor in a brain, and integrates electrophysiology, autonomic nerve and conducts to stress [Brain Res. Rev., 15, 71(1990); Pharmacol. Rev., 43, 425(1991)]. When CRF is administered in a cerebral ventricle of experimental animal such as a rat, anxiety conduct is observed, and much more anxiety conduct is observed in a CRF-overexpressing mouse as compared with a normal animal [Brain Res., 574, 70(1992); J. Neurosci., 10, 176(1992); J. Neurosci., 14, 2579(1994)]. In addition, α -helical CRF(9-41) of a peptidergic CRF receptor antagonist exerts an anti-anxiety action in an animal model [Brain Res., 509, 80(1990); J. Neurosci., 14, 2579(1994)]. A blood pressure, a heart rate and a body temperature of a rat are increased by stress or CRF administration, but the α -helical CRF(9-41) of a peptidergic CRF antagonist inhibits the increase in a blood pressure, a heart rate and a body temperature due to stress [J. Physiol., 460, 221(1993)]. The α -helical CRF(9-41) of a peptidergic CRF receptor antagonist inhibits abnormal conducts due to withdrawal of a dependent drug such as an alcohol and a cocaine [Psychopharmacology, 103, 227(1991); Pharmacol.

Rev.53, 209(2001)]. In addition, it has been reported that learning and memory are promoted by CRF administration in a rat [Nature, 375, 284(1995); Neuroendocrinology, 57, 1071(1993); Eur. J. Pharmacol., 405, 225(2000)].

5 Since CRF is associated with stress response in a living body, there are clinical reports regarding stress-associated depression or anxiety. The CRF concentration in a cerebrospinal fluid of a depression patient is higher as compared with that of a normal person [Am. J. Psychiatry, 10 144, 873(1987)], and the mRNA level of CRF in hypothalamus of a depression patient is increased as compared with that of a normal person [Am. J. Psychiatry, 152, 1372(1995)]. A CRF binding site of cerebral cortex of a patient who suicided by depression is decreased [Arch. Gen. Psychiatry, 15 45, 577(1988)]. The increase in the plasma ACTH concentration due to CRF administration is small in a depression patient [N. Engl. J. Med., 314, 1329(1986)]. In a patient with panic disorder, the increase of plasma ACTH concentration due to CRF administration is small [Am. J. 20 Psychiatry, 143, 896(1986)]. The CRF concentration in a cerebrospinal fluid of a patient with anxiety induced by stress such as obsessive-compulsive neurosis, post-psychic trauma stress disorder, Tourette's syndrome and the like is higher as compared with that of a normal person [Arch. Gen. 25 Psychiatry, 51, 794(1994); Am. J. Psychiatry, 154,

624(1997); Biol. Psychiatry, 39, 776(1996)]. The CRF concentration in a cerebrospinal fluid of schizophrenics is higher as compared with that of a normal person [Brain Res., 437, 355(1987); Neurology, 37, 905(1987)]. Thus, it has
5 been reported that there is abnormality in the living body response system via CRF in stress-associated mental disease..

The action of CRF on the endocrine system can be presumed by the characteristics of CRF gene-introduced animal and actions in an experimental animal. In a CRF-
10 overexpressing mouse, excessive secretions of ACTH and adrenal cortex steroid occur, and abnormalities analogous to Cushing's syndrome such as atrophy of muscle, alopecia, infertility and the like are observed [Endocrinology, 130, 3378(1992)]. CRF inhibits ingestion in an experimental
15 animal such as a rat [Life Sci., 31, 363 (1982); Neuropharmacology, 22, 337(1983)]. In addition, α -helical CRF(9-41) of a peptidergic CRF antagonist inhibited decrease of ingestion due to stress loading in an
experimental model [Brain Res. Bull., 17, 285(1986)]. CRF
20 inhibited weight gain in a hereditary obesity animal [Physiol. Behav., 45, 565(1989)]. In a nervous orexia inactivity patient, the increase of ACTH in plasma upon CRF administration is small [J. Clin. Endocrinol. Metab., 62, 319(1986)]. It has been suggested that a low CRF value is
25 associated with obesity syndrome [Endocrinology, 130,

1931(1992)]. There has been suggested a possibility that ingestion inhibition and weight loss action of a serotonin reuptake inhibiting agent are exerted via release of CRF [Pharmacol. Rev., 43, 425(1991)].

5 CRF is centrally or peripherally associated with the digestive tract movement involved in stress or inflammation [Am. J. Physiol. Gastrointest. Liver Physiol. 280, G315(2001)]. CRF acts centrally or peripherally, weakens the shrinkability of stomach, and decreases the gastric
10 excreting ability [Regulatory Peptides, 21, 173(1988); Am. J. Physiol., 253, G241(1987)]. In addition, α -helical CRF (9-41) of a peptidergic CRF antagonist has a restoring action for hypofunction of stomach by abdominal operation [Am. J. Physiol., 258, G152(1990)]. CRF inhibits secretion
15 of a bicarbonate ion in stomach, decreases gastric acid secretion and inhibits ulcer due to cold restriction stress [Am. J. Physiol., 258, G152(1990)]. Furthermore, α -helical CRF (9-41) of a peptidergic CRF antagonist shows the inhibitory action on gastric acid secretion decrease,
20 gastric excretion decrease, small intestinal transport decrease and large intestinal transport enhancement due to restriction stress [Gastroenterology, 95, 1510(1988)]. In a healthy person, mental stress increases a gas and abdominal pain due to anxiety and intestine dilation, and
25 CRF decreases a threshold of discomfort [Gastroenterology,

109, 1772(1995); Neurogastroenterol. Mot., 8, 9[1996]. In a irritable bowel syndrome patient, large intestinal movement is excessively enhanced by CRF administration as compared with a healthy person [Gut, 42, 845(1998)].

5 It has been reported from studies on experimental animals and clinical studies that CRF is induced by inflammation and is involved in a inflammatory reaction. In an inflammatory site of an experimental animal and in a joint fluid of a rheumatoid arthritis patient, production
10 of CRF is topically increased [Science, 254, 421(1991); J. Clin. Invest., 90, 2555(1992); J. Immunol., 151, 1587(1993)]. CRF induces degranulation of a mast cell and enhances the blood vessel permeability [Endocrinology, 139, 403(1998); J.Pharmacol. Exp. Ther., 288, 1349(1999)]. CRF
15 can be detected also in a thyroid gland of autoimmune thyroiditis patient [Am. J. Pathol. 145, 1159(1994)]. When CRF is administered to an experimental autoimmune cerebrospinal meningitis rat, the progression of symptom such as paralysis was remarkably inhibited [J. Immunol.,
20 158, 5751(1997)]. In a rat, the immune response activity such as T-lymphocyte proliferation and the natural killer cell activity is reduced by CRF administration or stress loading [Endocrinology, 128, 1329(1991)].

From the above-mentioned reports, it is expected that
25 the CRF receptor antagonistic compound would exert an

excellent effect for treating or preventing various diseases in which CRF is involved.

As a CRF antagonist, for example, peptide CRF receptor antagonists are reported in which a part of an amino acid sequence of CRF or associated peptides of a human or other mammals is altered or deleted, and they are reported to show a pharmacological action such as ACTH release-inhibiting action and anti-anxiety action [Science, 224, 889(1984); J. Pharmacol. Exp. Ther., 269, 564(1994); Brain Res. Rev., 15, 71(1990)]. However, from a pharmacokinetic point of view such as chemical stability and absorbability for oral administration in a living body, bioavailability and intracerebral transferability, peptide derivatives have a low utility value as a medicine.

Scheme 18

wherein R³ is an optionally substituted carbon atom, and each of symbols has a meaning defined above.

In step Z, compound (XXII) is prepared by removing a carboxyl-protecting group. Compound (XXI) or a salt thereof can be prepared by the procedures described in Methods A, B, E and Scheme 19.

All conventional methods used in a reaction for removal of a carboxyl-protecting group, for example, hydrolysis, reduction and elimination using a Lewis acid can be applied to the present reaction. It is preferable that hydrolysis is carried out in the presence of a base or

an acid. Examples of the suitable base include inorganic bases such as alkali metal hydroxide (e.g. sodium hydroxide and potassium hydroxide), alkaline earth metal hydroxide (e.g. magnesium hydroxide and calcium hydroxide), alkali metal carbonate (e.g. sodium carbonate and potassium carbonate), alkaline earth metal carbonate (e.g. magnesium carbonate and calcium carbonate), alkali metal bicarbonate (e.g. sodium bicarbonate and potassium bicarbonate), alkali metal acetate (e.g. sodium acetate and potassium acetate), alkaline earth metal phosphate (e.g. magnesium phosphate and calcium phosphate) and alkali metal hydrogen phosphate (e.g. disodium hydrogen phosphate and dipotassium hydrogen phosphate), and organic bases such as trialkylamine (e.g. trimethylamine and triethylamine), picoline, N-methylpyrrolidine, N-methylmorpholine, 1,5-diazabicyclo[4.3.2]non-5-ene, 1,4-diazabicyclo[2.2.2]non-5-ene and 1,8-diazabicyclo[4.3.0]-7-undecene. Hydrolysis using a base is carried out in water or a hydrophilic organic solvent or a mixed solvent in many cases. Examples of a suitable acid include formic acid, hydrochloric acid, hydrobromic acid and sulfuric acid.

The present hydrolysis reaction is usually carried out in an organic solvent, water or a mixed solvent thereof. A reaction temperature is not particularly limited, but is appropriately selected depending on a kind of a carboxyl-

protecting group and an elimination method. This elimination reaction is preferably carried out in the presence of a cation scavenger (e.g. anisole and phenol) and is usually carried out in a solvent such as nitroalkane (e.g. nitromethane and nitroethane), alkylene halide (e.g. methylene chloride and ethylene chloride), diethyl ether, carbon disulfide, and a solvent having no adverse effect on the reaction. These solvents may be used as a mixture thereof.

It is preferable that elimination by reduction is applied to elimination of a protecting group such as halogenated alkyl (e.g. 2-iodoethyl and 2,2,2-trichloroethyl) ester, and aralkyl (e.g. benzyl) ester. Examples of a reduction method using in the present elimination reaction include the conventional catalytic reduction in the presence of a combination of a metal (e.g. zinc and zinc amalgam) or a salt of a chromium compound (e.g. chromate chloride and chromate acetate) and an

organic or inorganic acid (e.g. acetic acid, propionic acid and hydrochloric acid); or the conventional metal catalyst (e.g. palladium carbon and Raney nickel). A reaction temperature is not particularly limited, but a reaction is carried out under cooling, at room temperature or under warming.

The thus obtained compound (XXII) can be isolated and purified by the known isolating and purifying methods, for example, concentration, concentration under reduced pressure, extraction with solvent, crystallization, recrystallization, transfer dissolution and chromatography.

A mixture of 2.25 g (12.5 mmol) of 3-nitrophenylisothiocyanate and 1.4 mL (10 mmol) of mesityl amine in 10 mL of methanol was stirred at room temperature for 2 h. The resulting precipitate was collected by filtration and dried to give a quantitative yield of 1-(3-nitrophenyl)-3-(mesityl)thiourea. Experiment 1

5 Measurement of Corticotropin-Releasing Factor (CRF) binding inhibitory rate

A receptor binding experiment was carried out using a human CRF receptor expressing CHO cellular membrane fraction and sheep CRF, [¹²⁵I]-tyr⁰(¹²⁵I-CRF). 100 nM of a

10 test compound was incubated with 1 μg of human CRF receptor expressing CHO cellular membrane fraction and 50 pM of ¹²⁵I-CRF in a binding assay buffer (50 mM Tris-HCl, 5 mM EDTA, 10 mM MgCl₂, 0.05% CHAPS, 0.1% BSA, 0.5 mM PMSF, 0.1 g/ml

pepstatin, 20 µg/ml leupeptin, pH 7.5). In addition, for measuring nonspecific binding (NSB), 0.1 µM unlabelled human Urocortin was incubated with 1 µg of human CRF receptor expressing CHO cellular membrane fraction and 50 pM of ¹²⁵I-CRF in a binding assay buffer. After a binding reaction was carried out at room temperature for 1 hour, the membrane was entrapped on a glass filter (UniFilter plate GF-C/Perkin Elmer) by suction filtration using a cell harvester (Perkin Elmer), and washed with ice-cooled 50 mM Tris-HCl (pH 7.5). After drying the glass filter, a liquid scintillation cocktail (Microscinti 0, Perkin Elmer) was added, and the radioactivity of ¹²⁵I-CRF remaining on a glass filter was measured using Topcount (Perkin Elmer).

$$\frac{(TB-SB)}{(TB-NSB)} \times 100$$
 (SB: radioactivity when a compound is added, TB: maximum binding radioactivity, NSB: nonspecific binding radioactivity) was calculated to obtain a binding inhibitory rate under the presence of 1,000 nM or 100 nM of each test substances.

Binding inhibitory rates of respective compounds measured by the aforementioned method are shown in Table 22.

Experiment 2

CRF antagonistic activity

The CRF antagonistic activity was obtained by measuring inhibition of Adenylate Cyclase activity induced by CRF. Measurement of intracellular cyclic AMP (cAMP) concentration was carried out using Alpha Screen Reagent (Perkin Elmer) according to the method described in the protocol attached to the reagent. Specifically, a human CRF receptor expressing CHO cell was inoculated on a 96-well plate at 40000 cells/well, cultured for 24 hours, the culture medium was sucked, and 1 μ M of test compound and 100 μ l of assay buffer (20 mM HEPES, Hanks' Balanced Salt Solution, 0.1% BSA, 100 μ M IBMX, pH 7.2) containing 1 nM of human CRF were added. In addition, in order to measure the intracellular cAMP concentration at stationary state, a compound and a buffer containing no CRF were added. After reacting at room temperature for 30 minutes, a buffer containing 1.5 μ g of Anti-cAMP acceptor beads was added thereto, 2 μ g of Biotin-cAMP/streptoavidin beads and a buffer containing 0.15% Tween 20 were added, the mixture were reacted at room temperature for 3 hours, and light emission was measured with Fusion (Perkin Elmer).

INDUSTRIAL APPLICABILITY

Compound (I) or (Ia) of the present invention has an excellent CRF antagonistic activity, and therefore useful as drugs for treating or preventing affective disorder, depression, anxiety, and the like.
